

ABSTRACT

Patent of invention "Process of simultaneous transfer of media data filing information".

5 Pursuant to this invention, the idleness of headsets contained in HDs is eliminated by distributing the signals of information among the headsets for parallel processing. Instead of having a form purely sequential of the data aligned on the sectors, as used in the state of the technique (figure 1), these data are distributed among the disk surfaces
10 (figure 2), altering the physical form of the disposal of the data, however maintaining the logical form and total compatibility of use for this process.
